

P4: Project Testing

(15% of the project grade)

Keep in mind that these documents might be updated during the semester.

Last updated: 05.10.2023.

Due Date

Thursday, November 16th at 23:59. We do not accept late submissions (i.e., they will not be graded).

Overview

P4 is 15% of the project grade and is about testing your website. You will test your website on other people and collect the results from the testing. It is **NOT** mandatory to change your website after the testing. If you want, you can, but mention this in section 7 of this delivery. Reuse your stylesheet for the project documents in this course.

Description

Testing is important for improving your website. Early feedback from the end-user is the best way to prevent design and implementation flaws. Testing or seeking review can mean several different things — showing the site to one person or to a group of colleagues, sending it out for informal review, or setting up a structured, formal test.

How to Test

There exist several testing methods like interviews, surveys and much more. This section outlines a few simple techniques to keep in mind when designing and carrying out your project testing.

- **Don't explain to the tester the things you're trying to test.** If you want to find out whether users can navigate through your site easily, don't give them verbal instructions beforehand for navigation. Use participants who are similar to the people who will be using your site. By watching and listening to your tester and reviewers carefully, you can not only uncover mistakes, but you'll also probably discover that your tester will offer good ideas that you can add to the site as you refine it.
- **Listen to what people tell you.** If they say the site is confusing, don't argue, say, "Thank you. What in particular is confusing?" The point is to find out how others perceive the site, not to defend your ideas. It's tempting to get defensive and just

assume the testers are being dense, but if you've chosen them wisely, they will be representative of the users you designed the site for.

- **Observe what people do when interacting with the website.** See what pitfalls people find, and what solutions they try, without offering your comments. If several users try the same solution, consider providing that capability in your site. If several users misunderstand an aspect of your site, redesign it. Be sure to test your site using different platforms (Mac's, PC's, mobile phones and tablets) and different browsers. Try changing the resolution of your monitor as well or view the site from a tablet or mobile phone. Take note of how the site looks and make sure it is still usable. (See the notes about Responsive Design, if you're interested in how to fix some problems that come from fixed layouts.

Minimum number of testers vary from which test method you are using.

***NOTE:** Students often create a Google Form and send it to as many people as possible to get feedback. While this allows for gathering plenty of feedback, it is not a substitute for the "real observation" of someone using your website. Thus, either during the lab session or in some other College setting, try to get a small number of users to do live testing of your website, while you are present to observe them. This will give you invaluable insight into how people are navigating and interacting with your website.*

Deliverables

Write an HTML document with the following structure and information:

1. **Header:** A title, the authors' names, and date.
2. **Administrative Details:** The name of your client, and his or her position in the organization (or company), if applicable.
3. **Testing Document:** A brief summary of the questionnaire you send out to testers, as well as the link to the Google Form you used. Don't forget to ask your client to test the website.
4. **Tester Audience:** A description of your efforts to reach testers that are similar to the website's intended audience and how successful you were (give the percentages of your tester audience once you aggregate their answers, e.g., 23% of college students, 46% school administrators, etc.) If you are collecting age-ranges, you can do the same. If you were able to do live testing with a few users, describe that as well.
5. **Testing Platforms:** A summary of the different platforms (devices and browsers) that your testers used.
6. **Feedback Summary:** A summary of the feedback you received organized by question type (design, navigation, content, usability, etc.). Highlight both positive comments and thoughtful criticism, your client's testimonial, etc.
7. **Your Response:** Provide your response to the feedback. Concretely, describe what you could do (once the class is over) to address this feedback with changes in your

design or implementation. You can also address why some of the raised issues or suggestions for improvements are difficult or impossible to tackle.

8. **Self-reflection:** Step back and reflect on the whole project experience and what you learned from it. Are there general lessons that you learned, beyond the nuts-and-bolts of HTML, CSS, and JavaScript? We would like you to take this seriously and be thoughtful about your comments, but there is no right or wrong answer here, so don't feel that you have to flatter us or try to divine what we want to hear.

Example

No examples for this project assignment.

Grading

Your document **P4_testing_GROUPNUMBER.html** should include all the components described above.

Points will be awarded for:

- Efforts to find testers from the intended audience or to do live testing.
- Use of a variety of devices and browser platforms.
- Concise and well-structured summary of the received feedback.
- Thoughtful and detailed response to the received feedback

Points will be deducted for:

- Missing self-reflection section.
- Poor writing and lack of document structure.
- Invalid HTML and CSS code. (Use the validation icons and check their results)

Delivery

Ensure to include all of the requested information in the file before delivering. Save the HTML file as **P4_testing_GROUPNUMBER.html** and publish it on your website. It is recommended to save P1 to P4 files in the same folder called **Documents** to have a structured web-hierarchy. Make sure to include a link to your website in the blackboard delivery.

Deliver a zipped (.zip) folder including all relevant files for the delivery, **AND** a link to your website on Blackboard by **Thursday, November 16th at 23:59**. We do not accept late deliveries and you cannot change the file after the deadline
